

Job Title: Backend Developer**Job Responsibilities**

- Design and deliver scalable, reliable architectural solutions that align with both business needs and technical requirements.
- Develop and maintain high-quality, secure, and performant code across multiple backend languages.
- Troubleshoot complex system issues and production incidents, perform thorough root-cause analysis, and drive timely resolutions.
- Mentor team members, conduct constructive code reviews, and champion engineering best practices across the organization.
- Leverage advanced AI and automation tools to accelerate product delivery, improve engineering productivity, and enhance solution quality.

Qualifications

- Strong proficiency in Node.js, Golang, or PHP, alongside hands-on experience managing MySQL, Cassandra, and Redis.
- Expertise in building event-driven architectures using RabbitMQ and Kafka.
- Proven experience deploying and managing infrastructure within AWS, utilizing Docker and Kubernetes for containerization and orchestration.
- Deep understanding of distributed systems, including tracing, logging, and monitoring using the Elasticsearch and Kibana (ELK) stack.
